### Alphabetical Listing Of Location Identifiers For Towered Airports FY 1978

Distribution: A-W-1; A-X (minus X (AS/AT/PL)-1 A-X (AS/AT/PL)-2;  
A-FAS-1; A-FAT-0 (LTD)

## ACKNOWLEDGMENTS

This report has been prepared by Pamela Kruzic and Thomas Henry who served as forecast team leaders under the direction of Gene Mercer, Chief, Aviation Forecast Branch. Contributions to the study were made by the forecast team of Bernard Hannan, James Hines, Janice Hartwill, Virginia Price, and Barbara Turner. In particular, the forecasts for the hub airports were prepared by Mr. Hannan and Mr. Hines. We are indebted to Max Rotermund, Native American Consultants, Inc., for overseeing the preparation of the final report and to many others who contributed in different ways to the final product.

The computer models were redesigned and executed by Carlton Wine, Leader, Policy Information Systems Branch. Mr. Wine and his staff organized and managed the data bases used to produce the forecasts, augmented the programs with new computer models, and carried out the computer operations necessary to produce the individual airport forecasts. Ms. Laurie Burch, Systems Analyst with the consulting firm of Acumenics Research and Technology, Incorporated, developed the Terminal Area Forecast Data System (TAFDS) for use by the FAA regional offices. The programming support of Robert Stanley, Laurie Windtberg and Larry Silvius is gratefully acknowledged.

Special acknowledgements are made to the Regional Planning Officers for their assistance in coordinating the regional reviews, state input, and final computer changes. The extensive reviews and comments of the regional offices were extremely important in guiding the forecast team in making adjustments to the preliminary version of the report. We are confident that the joint effort has produced a more accurate and creditable document than would have resulted had the interaction not taken place.

PART I:  
INTRODUCTION AND NATIONAL SUMMARY

#### SUMMARY HIGHLIGHTS

- o Forecasts were made for 934 airports--of these 430 are FAA towered airports.
- o The Southern Region has the largest number of FAA towers (83 towers). States with the most towers include California with 51, Texas with 27, and Florida with 26.
- o A total of 128 airports are currently at or are forecast to meet the initial criteria for tower candidacy prior to 1991. Fourteen of these are in Alaska, and 12 in Texas.
- o Total aircraft operations at FAA towered airports are expected to climb from 67.6 million in 1978 to approximately 100 million by 1991. Most of the growth will occur in general aviation flying.
- o The Western and Southern Regions are forecast to reach nearly 20 million and 19 million operations, respectively, by 1991--the largest shares among all regions.
- o New runway planning efforts will be required at 164 airports that have exceeded or are expected to exceed their practical annual capacity prior to 1991--32 are in California, 16 in Texas, and 13 in Florida.
- o Thirty-five airports are expected to reach severe congestion levels or have constraints placed on operations prior to 1991--6 are in California and 5 in Texas.
- o Currently, 92 percent of all air carrier passengers are enplaned at the top 100 air carrier airports.
- o The top 100 air carrier airports account for 82 percent of air carrier operations.
- o In 1978, the top 5 airports--Chicago, Atlanta, Los Angeles, New York (JFK), and San Francisco--enplaned nearly 28 percent of all air carrier passengers and accounted for 20 percent of all air carrier operations.
- o Air carrier enplanements, estimated at 283 million in 1978, are forecast to reach over 543 million by 1991.

## INTRODUCTION

→ This document presents forecasts of key aviation activity measures for 934 airports and radar approach control facilities through the year 1991. These forecasts are prepared to meet the planning needs of the Federal Aviation Administration (FAA) offices and services concerned with future traffic levels at these facilities. Except for specific regional requests, the airports selected for inclusion in this publication meet at least one of the following criteria:

- (1) Existing FAA tower;
- (2) Candidate for an FAA tower;
- (3) Currently receiving or forecast to receive certificated route air carrier or scheduled passenger commuter service; or
- (4) Any general aviation airport that will exceed 60,000 itinerant or 100,000 total operations annually by 1981. ↗

The Terminal Area Forecast (TAF) report is organized in two sections. The first part is a general summary. It includes summary highlights, the introduction, a brief overview of the forecast methodology, and a series of summary tables and charts. This summary provides a national overview as well as a comparison among regions.

Part Two contains the forecasts for each airport. It is arranged alphabetically by FAA region and, within each region, by state. The airports in each state are listed alphabetically by city. The airport data include summary information for the facility followed by three years of historical data and annual projections for fiscal years (FY) 1980 through 1991. In some cases, a comment about current or planned aviation activity at the airport is included. The summary indicates the airport's tower/nontower status, number of hours the tower is operated daily, and the number of aircraft based at the airport.

State and regional summary statistics precede the individual airport forecasts. For each region there are two charts depicting the current and forecasted levels of aircraft operations by user category for airports within the states. Following the charts are five tables that provide regional summaries and state comparisons from fiscal year 1976 through 1991 for air carrier enplaned passengers, air carrier operations, itinerant operations, total operations, and instrument operations.

## FORECAST METHODOLOGY

The general approach to the facility forecasts presented in this report is "top-down." National growth factors for each aviation activity were applied to the base year FY 1978 data at individual airports to project annual activity levels through the year 1991. Thus, the national growth rates obtained from FAA Aviation Forecasts: Fiscal Years 1980-1991, FAA-AVP-79-9 (September 1979) were utilized as control factors and initial rates of growth for individual airports. These preliminary projections were modified using several aviation activity models (discussed below) as well as the facility specific information provided by the 11 FAA regions.

The aircraft operations were adjusted to account for the capability of an airport to handle aircraft. As a general rule, no expansion of airport facilities has been assumed for this forecast. When an airport becomes congested, the growth of aircraft operations at that airport falls below the national average growth rates. In the years after the operating environment has been saturated, the forecasted total operations were assumed to remain constant. Unless additional facilities such as runways or electronic equipment that can safely reduce separation standards are installed, aircraft are expected to use other nearby airports.

Air carrier enplanements at the large air traffic hubs were also adjusted.\* To make these adjustments, a model was developed for forecasting enplanements disaggregated into hub originating, connecting, and returning passengers. Moreover, separate equations were developed for hubs characterized as industrial cities, trade centers, or recreation areas, and as connecting cities, terminating points, or intermediate cities. The results of the analysis showed that passengers originating at hubs are primarily dependent on income generated in the hub, while the number of connecting and returning passengers depends on income levels at associated destinations. Growth rates for enplanements at each of the hubs were developed based largely on Department of Commerce forecasts of income generated at these various hubs. These growth rates, which for the most part deviated from the national average, were used to adjust the enplanement forecasts at these hubs. Accordingly, the general top-down approach was augmented for airports within the larger hubs by specific forecasts of aviation activity at these airports.

\* Air traffic hubs are not airports; they are the cities and Standard Metropolitan Statistical Areas requiring aviation services and may include more than one airport.

Forecasts of general aviation aircraft operations were based on state parameters such as population, disposable personal income, and state area. Historical trends were modified in response to changes in availability of airport facilities and services, presence of reliever airports, and the attitudes toward general aviation activity at the subject airport. Additional sources of data included supplementary forecasts of general aviation activity at specific airports and regional forecasts of commuter and air taxi operations. Military operations were held constant at the level of operations reported in 1978.

The individual airport instrument operations forecasts reflect assumptions about the increased utilization of avionics by general aviation users and an increase in the number of terminal control areas (TCA) and terminal radar service areas (TRSA). The data for individual airports with approach control service include primary as well as secondary instrument operations. The national and regional instrument operations were forecast independently to avoid double counting of the secondary operations and are not the sum of the respective tower operations.

The FAA regional planning offices were asked to comment on the forecasts after they were generated. Updates of based general aviation aircraft and FY 1978 activity at nontowered airports were included in these regional comments. In addition, other information was received, including the status of plans for new runways and the possibility of new commuter service. These comments were incorporated in this series of forecasts subject only to the constraints imposed by the national forecasts.

After suggested changes and modifications for the 934 airports reviewed by the regions were incorporated in the TAF data base, the aviation activity data were aggregated to FAA regional and national totals. The resultant totals for aircraft operations and instrument operations at FAA facilities were within two percent of the forecast published in FAA Aviation Forecasts Fiscal Years 1980-1991 (FAA-AVP-79-9).

#### Activity Measures Forecast

The activities forecast for each airport include: certificated route air carrier, air commuter, and air taxi enplanements; air carrier, air taxi (including nonscheduled air taxi and scheduled commuter air carriers), and general aviation itinerant and local operations; and instrument operations. A short description of each activity follows.

Air carrier enplanements--includes originating, stopover, and transfer passengers of U.S. certificated route, intrastate, supplemental, and foreign flag air carriers. International passengers who disembark at airports to go through customs and then reenplane are included in an airport's count of passenger enplanements. The historical count of supplemental air carrier enplanements received from the Civil Aeronautics Board (CAB) was based on seats rather than passengers enplaned. Consequently, where supplemental enplanements were added to the other air carrier enplanement count, these data might be overestimated.

Air taxi enplanements--includes survey estimates of nonscheduled air taxi enplanements. Where data is unavailable, enplanement counts are estimated from the number of operations multiplied by a load-factor. The air taxi load factor typically ranges from 1 to 3.

Commuter enplanements--includes enplanements on scheduled commuter air carriers as reported by the CAB.

Local operations--those performed by aircraft that: (1) operate in the local traffic pattern or within sight of the airport; (2) are known to be departing for, or arriving from, flights in local practice areas located within a twenty-mile radius of the airport; or (3) execute simulated instrument approaches or low passes at the airport.

Itinerant operations--all aircraft operations other than local operations.

Total aircraft operations--the sum of itinerant and local operations. Every takeoff and every landing is counted as an aircraft operation.

Instrument operations--occur when an FAA operated terminal control facility handles the arrival, departure, or overflight of an aircraft on an IFR flight plan or provides IFR separation to other aircraft. The data published in this TAF include both instrument operations at primary and secondary facilities. Primary facilities are FAA towered airports with radar approach control service. Secondary facilities are airports (towered or nontowered) without radar approach control. Those instrument operations occurring at secondary airports are credited to both the primary facility and the airport where the physical operation occurs. Non-IFR instrument counts at existing terminal control area facilities and airports with Stage III of expanded area radar service are included under instrument operations. The facility forecasts were adjusted to reflect planned new terminal control areas and terminal radar service areas. Instrument operations are forecast for FAA operated military radar approach control facilities (Air Force RAPCON's and Navy RATCF's).

General Aviation Operations--all civil aviation operations except air carrier, air taxi, and commuter operations.

Instrument approaches--a series of predetermined maneuvers for the orderly transfer of an aircraft under instrument flight conditions from the beginning of the initial approach to a landing, or to a point from which a landing may be made visually.

This year's published TAF does not include forecasts of annual instrument approaches (AIAs). The historical and forecast data for AIAs are stored in the data base on the computer and are available, if requested, from the regional or headquarters offices.

The TAF data base contains almost 4,000 public-use airports including all airports in the National Airport System Plan. Activity levels and forecasts are available for the majority of these airports. However, the data for many of these airports have not received the high degree of scrutiny and review accorded the data for the 934 airports published in this volume.

#### Data Sources

Enplanements are based on data submitted to the CAB by the U.S. certificated route air carriers on Form 41 reports and by the U.S. air commuter carriers on Form 298 reports. These data are supplemented by an FAA survey of air taxi and intrastate operators, by reports of foreign flag traffic from the Immigration and Naturalization Service, and by state aviation commission and airport manager reports. These sources are used to compile enplanement figures for both towered and nontowered airports.

Historical operations at FAA towered airports are from FAA Air Traffic Activity reports. U.S. air carrier departures at nontowered airports were obtained from CAB Form 41 reports. Other operations at nontowered airports are based on special traffic surveys and on estimates provided in the FAA Airport Master Record FAA Form 5010-1.

Instrument operations handled by FAA towered airports and instrument approaches for all airports are reported in the FAA Air Traffic Activity reports. Region, state, city, airport name, and Location identifiers (LOCID) as well as an estimate of based aircraft are taken from the FAA Airport Master Record.

## NATIONAL SUMMARY AND COMPARISONS BY REGION

The TAF includes historical and forecast data for 934 airports through Fiscal Year 1991. Of this total, 430 airports had FAA air traffic control towers in June 1979. Figure 1 and Table 1 show the distribution of these towers throughout the United States. The largest number of FAA towers is located in the Southern Region (83 towers). California leads all states with 51 FAA towers. Texas is second with 27 towers and Florida was third with 26 towers. An alphabetical listing of location identifiers for all towered airports is presented in Appendix A.

Of the 934 airports included in the TAF, 470 airports (50%) registered 1,000 or more air carrier enplanements in FY 1978. In total, there were 10.6 million air carrier operations and an estimated 283.0 million air carrier passenger enplanements in FY 1978. The 330 towered air carrier airports had 10.1 million operations and 280.0 million enplanements. The nontower airports had only 500,000 air carrier operations and only 3.0 million enplaned passengers.

Table 2, Ranking of Air Carrier Airports by Passenger Enplanements, is a list of the top 100 air carrier airports in order of total passengers enplaned during FY 1978. Approximately 92 percent of all air carrier passengers are enplaned at the top 100 airports. The top 5 airports--Chicago, Atlanta, Los Angeles, New York (JFK) and San Francisco--enplaned 27.7 percent of all air carrier passengers. Approximately 52 percent of all air carrier enplanements in the United States occur at the top 15 busiest air carrier airports.

Tables 3 and 4 provide national summaries and regional comparisons from 1976 through 1991 for air carrier enplaned passengers and air carrier aircraft operations for all airports published in the TAF. Tables 5 through 7 show itinerant aircraft operations, total aircraft operations, and instrument operations at airports with FAA-operated air traffic control towers and radar approach control service (RAPCONS and RATCFS). The percent distributions of these various activities among the regions are shown in Tables 8 through 11.

Total aircraft operations at FAA towers equalled 67.2 million in FY 1978 and are forecast to climb to approximately 100 million by 1991. As shown in Figure 2, most of this growth will occur in the general aviation category. Figure 3 indicates the relative distribution of aircraft operations at FAA towered airports for FY 1978. The forecast operations by region and user category (Figure 4) show that the Western and Southern Regions will experience the largest growth.

During the forecast period, 128 nontowered airports are expected to meet the initial criteria for tower candidacy. The basic calculations used to determine candidacy depend upon the mix of air carrier, air taxi, general aviation, and military aircraft operations. A discussion of the criteria can be found in the Airway Planning Standard Number One, FAA Order 7031.2B (January 24, 1977). The calculations are described in FAA Report No. ASP-75-4, Establishment Criteria for Airport Traffic Control Towers (October 1975). The 128 airports are identified in Table 12.

FAA has published guidelines for determining when the number of operations relative to practical annual capacity (PANCAP) at an airport reaches a sufficiently high level to warrant consideration of additional runways. PANCAP provides an assessment of the runway capacity of an airport complex and does not include other airfield and terminal building elements. Based on FY 1978 data, 55 airports have already exceeded their practical annual capacities. Prior to 1991, 109 additional airports will exceed their practical annual capacities (see Table 13). A complete discussion of the methodology used to compute PANCAP values this year may be found in "Airport Capacity Criteria Used in Long-Range Planning," DOT, FAA, December 24, 1969 (AC150/5060-3A). In previous years, the PANCAP calculations were based on the methodology described in "Airport Capacity Criteria Used in Preparing the National Airport Plan, DOT, FAA, July 8, 1968 (AC150/5060-1A).

The forecasts in this volume do not assume construction of additional runways, runway extensions, or other enhancement of the existing facility at specific airports except where mentioned as a footnote to the individual forecast. It is assumed that an airport will be saturated when the forecast of total operations reaches twice the practical annual capacity.

As an airport approaches saturation, operations become increasingly delayed or restricted forcing users to seek alternative ways of overcoming these problems. Some flights will be moved to other hours, some will move to other airports, and some will be cancelled altogether. A review was made of those airports in this TAF that will reach 80 percent of saturation prior to 1991. These airports will experience about 40 minute delays per operation during peak hours. This translates into an average 7 to 8 minute delay per operation throughout the year. The number of airports that are in this category in the current TAF is considerably lower than the number estimated last year. The difference resulted from refinement in the methodology for computing PANCAP as well as known facility enhancements. The major changes in methodology are: (1) increases in the number of runway configurations analysed, and (2) increases in the number of aircraft mixes used to calculate PANCAP.

Table 14 provides a list of the 35 airports that have reached or are expected to reach 80 percent of saturation during the forecast period plus other constrained airports. Eleven airports are currently experiencing or are expected to experience significant operational constraints due to slot allocations or local physical, environmental, or political constraints. The forecasts of growth in operations at these airports reflect these constraints.

Tables 15, 16, and 17 indicate total, itinerant, and local general aviation aircraft operations for the almost 4,000 airports included in the TAF data base. It is estimated that the TAF data base represents approximately 80 percent of the total general aviation operations.

A summary of growth factors for general aviation itinerant and local operations by region and state for nontowered airports is provided in Table 18. These growth rates may be used as a guide for making or reviewing aviation activity projections at airports not included in the published TAF. The number of based aircraft at an airport is sometimes used as an index of aviation activity or potential aviation activity at specific airports or regions. Table 19 presents a summary of based aircraft by states and FAA regions as of June 1979. The total of 165,000 aircraft based at airports included in the TAF data base represents approximately 85 percent of the active general aviation fleet.

\* Assumes growth in operations at the national average growth rate. If the value in this column is lower than in the "1990" column, then growth at that airport is expected to exceed the national growth rate. If the value in the "1990" column is less than that in the "Saturation" column, then the forecast is based on the imposition of additional constraints.

COMMENTS: NEW FIXED BASED OPERATOR; RUNWAY EXPANSION COMPLETED WITH NEW ILS

ACE REGION

REGION: ACE  
STATE: KS  
CITY: Olathe

LOCID: OJC  
AIRPORT: JOHNSON COUNTY-EXECUTIVE ARPT

TOWERED  
DAILY OPERATING HRS: 16  
BASED AIRCRAFT: 328

| YEAR     | (---ENPLANEMENTS (000)---) |             |       |       | (-----AIRCRAFT OPERATIONS (000)-----) |               |     |     |       |               |     |       |               | INST.<br>OPS.<br>(000) |

COMMENTS: HISTORICAL DATA FROM AIR TRAFFIC SURVEY; ESTIMATE AIR TAXI LOAD FACTORS

REGION: AGL  
STATE: IL  
CITY: PEORIA

LOCID: PIA  
AIRPORT: GREATER PEORIA

TOWERED  
DAILY OPERATING HRS: 24  
BASED AIRCRAFT: 146

COMMENTS: STATE ESTIMATE FOR 1978 BASED AIRCRAFT AND GA OPERATIONS

REGION: AGL  
STATE: WI  
CITY: WAUKESHA

LOCID: UES  
AIRPORT: WAUKESHA COUNTY

NON-FAA TOWER  
DAILY OPERATING HRS: 8  
BASED AIRCRAFT: 180
